

Leak Guard CRM — Recall on Another Machine

How to pick up the project on a new PC via GitHub · updated 2026-06-27 · repo: github.com/innoaid/leak-guard-crm (public)

The repo is **public**, so cloning / pulling needs **no GitHub login**. You only need to sign in to **push** changes back.

One-time prerequisites

- Install **Git** → git-scm.com
- Plus **one** of: **Claude Code CLI** (for PowerShell), or the **Claude Code desktop app** (download + sign in).

Path A — PowerShell + Claude Code (CLI)

```
# 1. Make / choose a parent folder
mkdir C:\projects -Force
cd C:\projects

# 2. Clone from GitHub (public repo — no login needed to pull)
git clone https://github.com/innoaid/leak-guard-crm.git

# 3. Go into the project
cd leak-guard-crm

# 4. Launch Claude Code in this folder
claude
```

Then type to Claude: `recall this project — read docs/SESSION_HANDOFF.md`

(Claude auto-reads `CLAUDE.md`, which points to the handoff doc.)

Path B — Claude Code desktop app

1. Install the app and sign in.
2. Get the code locally first — open its built-in terminal (or PowerShell) and run:

```
cd C:\projects
git clone https://github.com/innoaid/leak-guard-crm.git
```

3. In the app: **Open Folder** → **C:\projects\leak-guard-crm**
4. Ask Claude: `recall this project — read docs/SESSION_HANDOFF.md`

Every session after that

- **Start:** `git pull` (get the latest before touching anything).
- **Before you leave:** `git add -A; git commit -m "what I changed"; git push` (the GOLDEN RULE).

Good to know

- A fresh clone lands you in **one clean folder (leak-guard-crm) on main** — exactly the single-folder setup (no -r69 worktree).
- **Pulling = no login. Pushing = needs GitHub auth** — when `git push` prompts, sign in (or set up a Personal Access Token / SSH key once).
- Claude's memory from the old PC won't transfer — that's why `docs/SESSION_HANDOFF.md` exists; it + `README.md` + `docs/ARCHITECTURE.md` recreate the full context from GitHub alone.

- First task when you're back: redeploy kanban_code.gs (Apps Script → New version) — the one item gating the Ad Report + express fixes.

The two deploy targets (reminder)

You changed...	How it goes live
*.html (kanban, booking, estimation...)	git push to main → GitHub Pages auto-deploys to leakguard.my (~1–3 min; hard-refresh)
*.gs (kanban_code.gs, autocount.gs)	Paste into Apps Script editor → Save → Deploy → Manage deployments → New version
n8n workflows	Edited live in n8n cloud (backed up locally only)
